# Visual Evidence

## One observed moment

### Image evidence prompt

Submit one original screenshot or still of your Case Study 1 Atari game. Caption it with the title, version or platform when known, the scene shown, and its source. A relevant image from your first case study may be reused.

**Requirements and potential deductions**

- The image shows the original scene used for this redesign. (up to -0.5 points)
- The caption identifies the selected Atari game, scene, and image source. (up to -0.5 points)

Caption: Garfield for the Atari 2600. The image shows the second playable screen within the game which is filled with moving flower pots that damage the player. Garfield can jump to each fence and can duck to avoid the flower pots. The score as well as total lives are seen at the bottom. This image was taken from a longplay of Garfield for the Atari 2600: https://www.youtube.com/watch?v=ST5A2_sucCY

# Visual Redesign

## Improvement goal

### Response prompt

Identify one visual problem in the original scene and explain the mood or player experience your redesign should support. Refer to a specific detail in the original image.

**Requirements and potential deductions**

- Identifies a visual problem using a specific detail from the original scene. (up to -0.75 points)
- Explains the intended mood or player experience of the redesign. (up to -0.75 points)

### Submitted response

The major problem with the color scheme and design of the game is that the player doesn't know what an object does until they interact with it. For example, within the scene, you can see a flower pot that is flying from one side of the screen to the other. If player gets to this screen for the first time, they wouldn't know if the flower pot is dangerous or not. They would only realize tha flower pot is actually dangerous after getting hit by one, losing a life, and getting reset to the start of the screen again. My redes should aim to make things such as these clear for the player, such as clearly making an object that is dangerous completely re red-tinted to show that it's dangerous.

## Revised palette

### Response prompt

List your proposed colors and their roles, including any neutrals. Explain why this palette size and a named color relationship suit your improvement goal, and how contrast makes an important element stand out. Color names or swatches are sufficient; exact color codes are optional.

**Requirements and potential deductions**

- Identifies the proposed colors and what each is used for. (up to -0.5 points)
- Justifies the palette size and a named color relationship using the improvement goal. (up to -0.75 points)
- Explains a contrast choice that makes an important element stand out. (up to -0.75 points)

### Submitted response

In the case of this game, I don't believe it necessarily requires a heavy redesign for the color palette. The main changes would using stronger colors for each object. In particular, a stronger / darker red and a bright orange would work perfectly for indicatin object might be dangerous with the already dark background, while also using blues or greens for safe interactables such as th fences and burgers. Other than that, I believe that the points and lives can probably stay the same as they operate from the ma gameplay area, making it easy to see and keep track of for the player.

## Redesigned scene

### Image evidence prompt

Submit a colored sketch, annotated recoloring, or mockup of the same scene using your proposed palette. Include a gameplay element and an interface or state indicator. Keep an important state understandable without color alone, using a label, shape, or icon. Caption the image to identify the scene and your changes.

**Requirements and potential deductions**

- The redesign applies the proposed palette to the same scene's gameplay element and interface or state indicator. (up to -1.25 points)
- An important state has an understandable label, shape, or icon in addition to its color. (up to -1.25 points)

Caption: My recolored version of Garfield for the Atari 2600. The scene focuses on just using brighter colors to make each interactable stand out more. I used a darker red and bright orange to indicate a dangerous object, blue for the interactable fence and just used a brighter orange for Garfield.

## Look and feel decision

### Response prompt

Explain one visual change beyond the palette, such as composition, interface layout, character shape, or an animation you would add. Connect it to a relevant Chapter 6 concept from vision, interface, ambience, or storytelling and explain its intended effect on the player. Describe motion in words if your sketch cannot show it.

**Requirements and potential deductions**

- Connects a specific visual change beyond the palette to a relevant Chapter 6 concept. (up to -0.75 points)
- Explains how that change would affect the player's experience. (up to -0.75 points)

### Submitted response

If I could make another visual change beyond just changing the color palette, I would make it more obvious that something is dangerous by adding a danger or hazard icon with an arrow next to it pointing where a dangerous object is coming from. This connects to the idea of interfaces from chapter 6. Where information should be helpful without distracting the player. The warni should make it easier for the player to understand where the danger is going to come from while still keeping the main gamepla together.

## Evaluate the redesign

### Response prompt

Compare your redesign with the original scene. Explain how the revised visuals work together to address your improvement goal while keeping the game's core actions and rules. Refer to a specific difference visible in the two images.

#### Requirements and potential deductions

- Evaluates the combined effect of the revised visuals on the improvement goal using a specific before-and-after difference. (up to -0.75 points)
- Explains how the original core actions and rules remain intact. (up to -0.75 points)

### Submitted response

Comparing both scenes, my redesign makes the most important objects a little easier to see by giving the hazardous objects, l flower pot, a darker and brighter red and orange, while also making any interactables, such as the fence, which the player shou know has meaning, a brighter blue. If the added visuals are included, they would give the player another way to recognize any approaching danger without changing anything gameplay-wise. The original gameplay would stay the same, while the interface visuals would stay the same to make it easier for the player to understand.
